OLOGUN MCDANIEL OLUMIDE

mcdanielologun@gmail.com | 08080712179 | Lagos, Nigeria

OBJECTIVE

Second-year Electrical and Electronics Engineering student at the University of Lagos with hands-on experience delivering automation systems and CAD design work. Seeking an internship opportunity in electrical engineering or a related engineering discipline to apply and grow technical, design, and problem-solving skills in a professional environment.

EDUCATION

University of Lagos (UNILAG) — Lagos, Nigeria
B.Sc. Electrical and Electronics Engineering
Second Year | CGPA: 4.2/5.0 | Expected Graduation: 2028/2029

LEADERSHIP & ACTIVITIES

SEES Innovation Hub — Assistant Head of Operations & Quasi Head of Design Engineering
Support operational planning within the hub and coordinate design engineering deliverables across active projects. Currently co-leading the development of a LoRa Campus Messaging Network and a Campus Air Quality Monitor Network, two hardware systems that have been unified under a single enclosure design in Fusion 360.

PROJECTS — CAD & DESIGN ENGINEERING

TWS Earbuds 3D Model *Jul 2025 – May 2026*

Modeled a pair of true-wireless earbuds from scratch in Fusion 360, working through the Form/Sculpt workspace for organic shaping, sketch-and-extrude methods for the main body, and revolve-based techniques to construct the ear tips, before assembling the final parts into a complete unit.

DC Motor Model *Jul 2025 – May 2026*

Produced a detailed CAD model of a DC motor, breaking down its internal components for engineering visualization and as a reference piece for coursework and portfolio use.

Mobile Phone Model *Jul 2025 – May 2026*

Designed a full mobile phone enclosure and body in Fusion 360, focusing on realistic proportions, surfacing, and component layout.

Wind Turbine Modeling (VAWT & HAWT) *Jul 2025 – May 2026*

Modeled two wind turbine designs in Fusion 360: a Darrieus-style vertical-axis turbine with helical blades, and a conventional three-blade horizontal-axis turbine, exploring different approaches to blade geometry and structure.

Forklift Design Project (University Course Project) *Jul 2025 – May 2026*

Contributed as part of a team tasked with designing a forklift for a university design engineering course, working through the mechanical design considerations and collaborating with teammates on component layout and structure.

Design Engineering Portfolio *Jul 2025 – May 2026*

Independently produced a portfolio of 12 SVG engineering drawings spanning enclosures, panel layouts, mounting structures, and electrical/energy devices such as solar panels, wind turbines, inverters, battery banks, and MPPT controllers — built specifically to demonstrate design engineering range for internship applications.

PROJECTS — SOFTWARE AUTOMATION & AI INTEGRATION

Shopbot — Customer Service Chatbot *Jan 2026 – May 2026*

Built an AI-powered customer service chatbot for a client to handle incoming inquiries and support requests automatically, reducing manual response time and ensuring consistent, round-the-clock coverage for common customer questions.

Email Classification AI Agent *Jan 2026 – May 2026*

Designed and deployed an n8n workflow that captures incoming emails through a webhook, uses GPT-4o-mini to interpret and classify each message, processes the result through a custom code node, and routes the email accordingly through Gmail — removing the need for manual sorting.

AI Lead Qualification Pipeline *Jan 2026 – May 2026*

Combined Voiceflow, n8n, and Google Sheets into a single pipeline that automatically qualifies inbound leads based on conversation data, logging results for the sales team to act on immediately.

GrowthPath Digital Consulting — AI-Powered CRM & Qualifier Bot *Jan 2026 – May 2026*

Built a capstone CRM system for GrowthPath Digital Consulting using n8n, Airtable, and a custom Google Gemini agent ("Aria") to manage client data and interactions end-to-end. Extended the qualifier bot so that qualified leads automatically get a meeting scheduled on the calendar, while unqualified or under-qualified candidates receive an automated, personalized follow-up email sequence through Zapier — keeping the entire pipeline running with minimal manual input.

PROJECTS — PROGRAMMING

RLC Circuit Simulator (Python) *2026*

Built a Python-based RLC circuit simulator using NumPy, SciPy, and Matplotlib that takes interactive user input with validation, automatically classifies the circuit's damping behavior (overdamped, underdamped, or critically damped), and generates multi-panel visualizations of the voltage and current response. Published on GitHub: github.com/Trexx16/rlc-circuit-simulator.

SKILLS

- CAD & Design: Fusion 360
- Automation Platforms: n8n, Zapier, Make.com, Voiceflow
- Prompt Engineering
- Programming: Python (NumPy, SciPy, Matplotlib)
- Technical Skills: Electrical installations, equipment repair and troubleshooting, and related hands-on electrical work
